

Data Visualisation

Custom Dashboards

- Dashboards provide a centralised display of key metrics and performance indicators, updated in real-time or after data processing.
- **Example:** A dashboard for mapping a drone might display the current flight path, battery status, speed, altitude, and remaining flight time.
- Operators can quickly assess the drone's status and make adjustments as needed.

Interactive Maps

Alt text: An interactive map illustration

- Interactive maps allow users to visualise the drone's flight path, waypoints, and areas of interest, providing spatial context to the data.
- **Example:** After a survey mission, an interactive map could show the exact route the drone took, highlighting waypoints where specific data was collected.
- Users can click on each waypoint to view detailed information such as altitude, speed, and sensor readings.

3D Models

- 3D models offer a comprehensive view of the flight environment and drone performance, enabling in-depth analysis and presentation.
- **Example:** For an infrastructure inspection, a 3D model could reconstruct the building or bridge being inspected, overlaying data points where the drone captured images or sensor readings.
- This allows engineers to assess structural integrity from different angles and depths.
