

Drone Blueprint Design

Activity: Design a drone blueprint based on your understanding of its key components.

Instructions:

1. Select a specific purpose for your drone (e.g., aerial photography, package delivery, search and rescue, or environmental monitoring).
2. Draw the basic structure of the drone, considering its components, based on its purpose.
3. Add and label the following components on your blueprint:
 - Propellers (indicate rotation direction)
 - Motors
 - Electronic Speed Controllers (ESCs)
 - Flight Controller
 - Battery
 - Sensors relevant to the drone's purpose
 - Payload (e.g., camera, delivery mechanism)
4. For each component, provide brief specifications or notes, such as:
 - Propeller size and material
 - Motor KV rating
 - Battery capacity
 - Types of sensors used

5. On a separate sheet or the back of the blueprint, write a short paragraph explaining:

- The drone's intended purpose
- How the chosen components support that purpose
- Any special features of your design

Show your work on a Word file and discuss with your peers/mentor for feedback
