

Editing Flight Missions in GCS

To create and edit flight missions using Ground Control Station (GCS) software for a drone, follow these steps:

Choose GCS Software

Select compatible software, such as Mission Planner for ArduPilot, QGroundControl for PX4, or DJI Assistant for DJI drones.

Connect to Drone

Establish a connection via telemetry link (radio, WiFi, or USB).

Open Mission Planning Interface

Access the mission planning section within the GCS software.

Create a Mission

Start a new mission by selecting the appropriate option in the software.

Set Waypoints

Define waypoints by clicking on the map, entering coordinates, or importing them.

Specify Flight Parameters

Set altitude, speed, loiter time, and any actions to be performed at each waypoint.

Edit Mission

Adjust waypoint details, order, or other mission parameters as needed.

Save Mission

Save the mission plan within the software for later use.

Upload to Drone

Transfer the mission plan to the drone's autopilot system.

Execute Mission

Initiate the mission, allowing the drone to follow the planned path autonomously.

Monitor Progress

Track the mission in real-time using the GCS software's monitoring features.
